PLACEHOLDER™, a VaporGrip Xtra Agent is Now Approved by Bayer

What is a Volatility Reducing Agent?

A Volatility Reducing Agent (VRA) is a tank mix adjuvant that delivers additional VaporGrip® Technology to spray solutions for further reduction of potential dicamba volatility.

Why is a VRA adjuvant required by the EPA for Dicamba?

When dicamba is used as a herbicide there is the risk of drift into unwanted areas. The volatility of dicamba under certain circumstances increases this risk and can be mitigated by adding an adjuvant with VRA technology that decrease the volatility.

There are several factors that contribute to the volatility of dicamba. At a lower pH, the dicamba salt converts easily to dicamba acid. Dicamba acid is the volatile form which increases volatility of the herbicide solution.

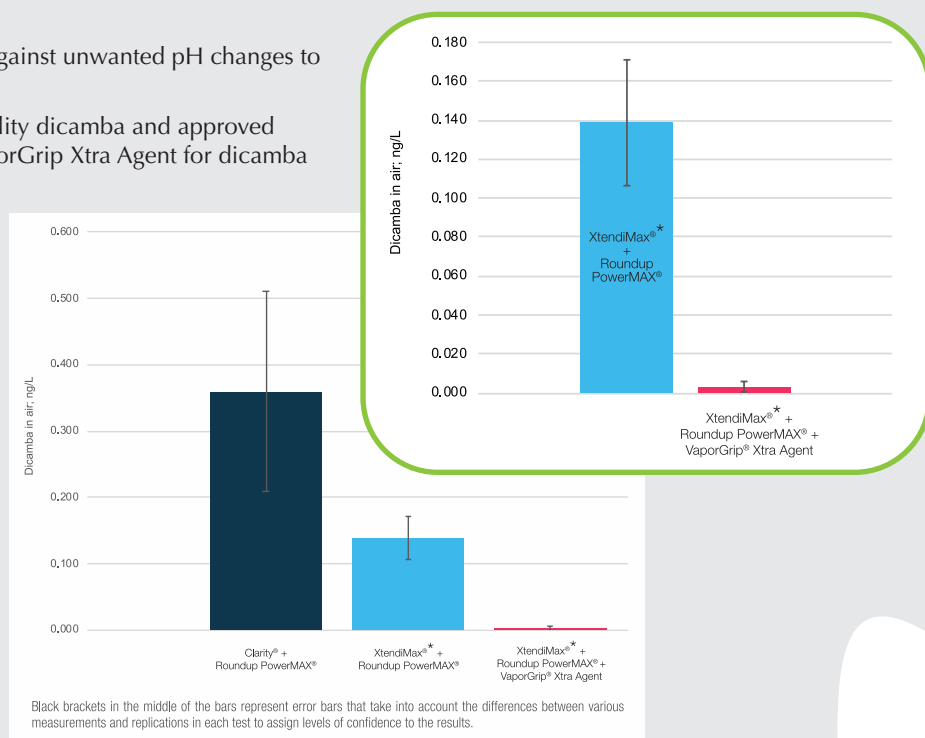

The formation of dicamba acid is influenced by a number of factors:

- The type dicamba (First generation vs later generation)
- Other tank-mix partners
- Overall solution pH

PLACEHOLDER, a VaporGrip Xtra Agent buffers against unwanted pH changes to prevent dicamba acid formation.

It is important to only utilize approved low-volatility dicamba and approved tank-mix partners such as PLACEHOLDER, a VaporGrip Xtra Agent for dicamba applications.

Humidome** studies measuring the air concentration of dicamba demonstrate that VaporGrip® Xtra Agent provides additional volatility reduction.

PLACEHOLDER, a VaporGrip Xtra Agent has been tested!

PLACEHOLDER, a VaporGrip Xtra Agent has been thoroughly tested* in field trials by Bayer and US academic weed scientists and has been approved by Bayer.

PLACEHOLDER, a VaporGrip Xtra Agent performance has been validated through low-tunnel trials conducted in cooperation with US Academic Weed Scientists across key soybean growing areas.

If you have any questions about PLACEHOLDER, a VaporGrip Xtra Agent or availability, contact your SSM.
